

## FACT SHEET MATCHING

The bank account reconciliation process can be time-consuming and very manual. By automating and streamlining your reconciliation processes with Nomentia Matching you can significantly reduce the time and effort needed and reduce your unallocated cash.

### A single tool for multiple systems

With Nomentia Matching, you can easily include different types of transactions from multiple source systems into one system and streamline and simplify transaction processing. When the handling of the transactions can be done in a single tool, users do not need to continuously switch between different systems or try to manage various processes for handling all the different types of transactions. In addition, when all the data is available in one system, monitoring and reporting becomes much easier and more efficient.

### Simplify your processes

With Nomentia, you can easily handle different types of matching processes using a single tool. The matching processes can be defined based on your needs instead of defining them on your system's terms. A shared process enables smooth collaboration between the different parts of your organization.

Nomentia Matching utilizes machine learning algorithms and allows you to achieve a highly automated and flexible matching process. In addition, our tool assists the users through the remaining manual phases in the process, which for one also contributes to more efficient and secure transaction handling.

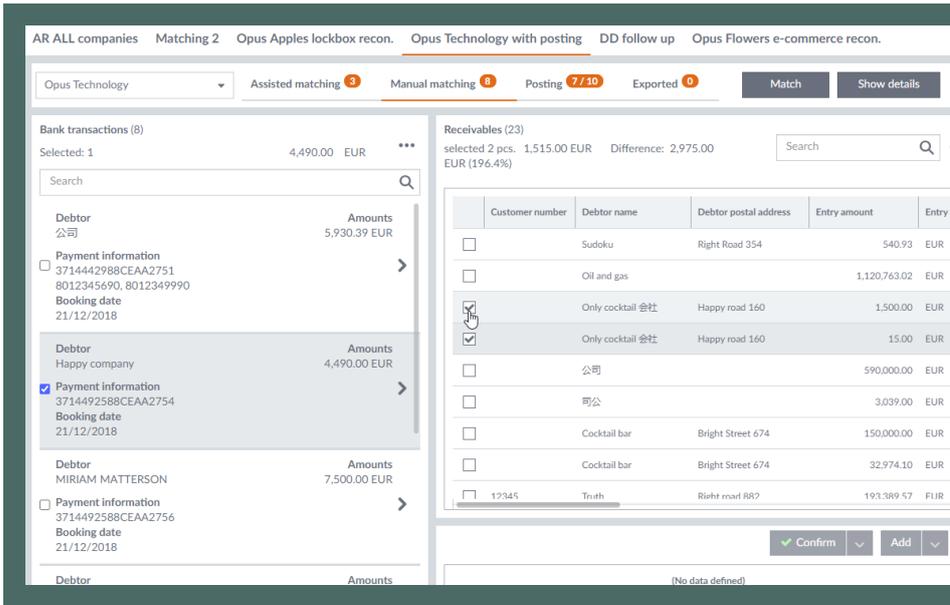

### Advanced data enrichment

The automation ratio of matching can be increased further by enriching the transaction information. Often the data is not accurate enough to enable efficient automation. With Nomentia Matching, you can enrich the transaction data from various sources and make it available in the matching process. This will increase the automatic matching percentage and reduce the need for carrying out manual searches for additional information from several different systems.

#### Key benefits

- Reduces manual work
- Enhances automation
  - Increases visibility
- Enables continuous development

# FACT SHEET | Matching

## Quick facts

- Process data from multiple financial systems
- Efficient monitoring and reporting
- Enrich limited data to increase automation rates
- Assisted matching supports exception handling
- Easy process documentation inside the system
- Encourages and empowers users to continuously develop the process further

## Enable continuous development

With Nomentia Matching, users can also effortlessly increase the automation in the matching processes. The system allows an easy to understand way for improving the processes further: the users do not need knowledge of programming or scripting languages to create new automation rules. The efficiency of the processes is continuously monitored, and changes can be easily made in the drag-and-drop user interface.

You can empower your team by offering them the possibility to continuous enhancement. By doing

this, you can gain the impact of process improvements faster and at the same time lower the threshold for creating continuous development.

## Harness Matching to do the following

- Balance reconciliation
- AR reconciliation
- AP reconciliation
- Intercompany settlements
- E-commerce/PSP/POS matching

## Nomentia Solutions

Nomentia offers unparalleled Cash Visibility, Workflow Automation, and Risk Management. We believe in a world in which businesses can make the right decisions no matter how unpredictable the times are. Our SaaS-based platform offers solutions for cash forecasting and visibility, global payments with bank connectivity, reconciliation, and in-house banking.
